 WDT → RST

## ● WDT operation (Time-out mode)

### When the MCU is operating normally

If the MCU strokes (= initializes) the WDT once every 5 minutes,

the WDT determines the MCU is operating normally.

Signal from MCU to WDT

### When the MCU is malfunctioning

If the MCU does not stroke (= initialize) the WDT in a 5 minute period,

**RESET!**

the WDT detects the MCU fault and barks (= reboots).

Signal from MCU to WDT

The WDT sends a reset signal to the MCU if does not receive a response within the set timeout period.
